- Plumber's tape
- Bucket or towel
- Utility knife
- Faucet installation kit (usually included with the faucet)
- Safety goggles

Preparation Steps

Before diving into the actual installation, it's crucial to prepare your workspace and familiarize yourself with the components of your new Kohler faucet.

1. Turn Off the Water Supply

Locate the shut-off valves under your sink and turn them off. If you cannot find them, turn off the main water supply to your home. Open the faucet to

release any remaining water in the lines.

2. Remove the Old Faucet

If you are replacing an existing faucet, follow these steps:

1. Disconnect the water supply lines from the old faucet using an adjustable wrench.
2. Remove the mounting nuts that hold the faucet in place. You may need a basin wrench for tight spaces.
3. Lift the old faucet out and clean the sink surface of any debris or old caulk.

Installing Your New Kohler Faucet

Now that you have prepared the area and removed the old faucet, you can proceed with installing your new Kohler faucet.

1. Assemble the Faucet Components

Carefully unpack your Kohler faucet and familiarize yourself with its parts. Most Kohler faucets come with an installation guide that outlines the individual components. Generally, you will have:

- The faucet body
- Handles (if applicable)
- Mounting hardware (nuts, washers, etc.)
- Water supply hoses
- Plumber's tape

2. Install the Faucet Body

Follow these steps to install the faucet body:

1. Insert the faucet through the mounting hole in the sink. If your faucet has multiple holes, ensure the escutcheon plate is aligned properly.
2. Underneath the sink, place the metal or plastic washer over the faucet's shank, followed by the mounting nut. Hand-tighten the nut, and then use the adjustable wrench to secure it further. Be careful not to overtighten, which could damage the sink.

3. Connect the Water Supply Lines

Next, you'll connect the water supply lines:

1. Wrap the threads of the faucet's inlet with plumber's tape to ensure a watertight seal.
2. Attach the hot and cold water supply hoses, tightening them with an adjustable wrench. Remember to connect the hot water line to the left side and the cold line to the right.

4. Install the Handles

If your Kohler faucet has separate handles, follow these steps:

1. Align the handles with their respective stems on the faucet body.
2. Secure the handles in place with the provided screws, using a screwdriver. Ensure they are tight but avoid overtightening.

Finalizing the Installation

With the faucet body and handles installed, it's time to finalize your installation.

1. Check for Leaks

Before securing everything completely, it's essential to check for leaks:

1. Turn on the water supply by opening the shut-off valves.
2. Turn on the faucet and let the water run for a few moments.
3. Inspect all connections for leaks. If you notice any leaks, turn off the water supply and tighten the connections as necessary.

2. Install a Sprayer (if applicable)

If your Kohler faucet comes with a sprayer, follow these additional steps:

1. Locate the sprayer hose and connect it to the spray head.
2. Feed the hose through the sink and connect it to the water supply. Tighten it securely using an adjustable wrench.
3. Test the sprayer by turning on the faucet and activating the sprayer to ensure it functions correctly.

3. Caulk Around the Base

To prevent water from seeping underneath the faucet base, apply a bead of caulk around the base of the faucet. This step is especially important for sink installations.

Maintenance and Care

After successfully installing your Kohler faucet, it's essential to maintain it properly to ensure its longevity and performance. Here are some tips:

- Regularly clean the faucet with a soft cloth and mild soap to prevent mineral buildup.
- Avoid using abrasive cleaners, as they can scratch the finish.

- Inspect the hoses and connections periodically for any signs of wear or leaks.

Troubleshooting Common Issues

Even with proper installation, you may encounter some common issues. Here are a few troubleshooting tips:

1. Dripping Faucet

If your faucet drips, it might be due to a worn-out washer or O-ring. Turn off the water supply, disassemble the faucet, and replace the necessary components.

2. Low Water Pressure

Low water pressure can occur if the aerator is clogged. Remove the aerator from the faucet head, clean it thoroughly, and reattach it.

3. No Water Flow

If your faucet doesn't dispense water at all, check to ensure the shut-off valves are open and that there are no kinks in the supply lines.
