Definition and Characteristics

Unlike single-step equations that require only one operation, multi-step equations present a greater challenge as they demand a structured approach to solving. Characteristics of multi-step equations include variables on one or both sides of the equation, parentheses requiring distribution, and the presence of like terms that must be combined.

Common Types of Multi-Step Equations

Examples of multi-step equations include:

- Equations involving the distributive property, such as $3(x + 4) = 18$
- Equations with variables on both sides, like $2x + 5 = x + 12$
- Equations requiring the combination of like terms and simplification before solving
