Experimental Setup

To effectively study the kinematics of machinery, students will engage in various experiments that involve different mechanisms. Below are some key experiments that will be conducted, along with their setups.

Experiment 1: Study of Four-Bar Chain Mechanism

Objective: To analyze the motion of a four-bar chain mechanism and determine its velocity and acceleration characteristics.

Materials Required:

Procedure:

1. Set up the four-bar linkage model on a stable surface.
2. Adjust the input link to a specific angle using the protractor.
3. Measure the output angles of the coupler and the output link.
4. Record the time taken for one complete cycle of motion.
5. Repeat the measurements for various input angles and document the results.

Analysis:

- Calculate the angular velocity and acceleration of each link using the recorded data.
- Create a velocity diagram to visualize the motion of each link.

Experiment 2: Analysis of Crank-Slider Mechanism

Objective: To investigate the relationship between the crank angle and the slider position in a crank-slider mechanism.

Materials Required:

- Crank-slider apparatus

- Data acquisition system

Procedure:

1. Set up the crank-slider mechanism and ensure it is securely mounted.
2. Connect the motion sensor to the data acquisition system.
3. Rotate the crank manually at a steady speed and record the position of the slider.

4. Vary the crank speed and repeat the measurements.

Analysis:

- Plot the position of the slider against the crank angle to observe the relationship.
- Derive the equations of motion for the slider based on the crank angle.

Experiment 3: Velocities in a Cam Mechanism

Objective: To study the velocity characteristics of a cam mechanism and analyze the follower movement.

Materials Required:

- Cam mechanism model
- Protractor
- Stopwatch

Procedure:

1. Set up the cam mechanism on a flat surface.
2. Rotate the cam manually and observe the follower's movement.
3. Measure the displacement of the follower for different cam angles.
4. Record the time taken for the cam to complete a rotation.

Analysis:

- Determine the velocity of the follower at different points of the cam's rotation.
- Graph the velocity of the follower against the cam angle.
