Basic Mathematical Expressions

Understanding the foundations of LaTeX math mode is crucial for writing any mathematical document. LaTeX provides two primary modes to include math: inline math mode and display math mode. Inline math mode is used for expressions within a paragraph, whereas display mode is intended for standalone equations.

Math Modes

To enter inline math mode, enclose your expression within dollar signs `$ ... $`. For example, `$a^2 + b^2 = c^2$` renders as $a^2 + b^2 = c^2$ within text. Display math mode, which centers the equation on its own line, uses double dollar signs `$$ ... $$` or the `\[ ... \]` delimiters.

Basic Symbols

LaTeX supports basic arithmetic operators such as $+$, $-$, $*$, and $/$ directly. Parentheses and brackets are typed as usual but can be resized dynamically using commands like `\left( ... \right)` for better visual alignment with complex expressions.

Fractions, Roots, and Exponents

Mathematical notation often requires fractions, roots, and powers. LaTeX provides straightforward commands to express these elements clearly and elegantly.

Fractions

The command `\frac{numerator}{denominator}` creates fractions. For instance, `\frac{a+b}{c+d}` displays as a neatly formatted fraction with numerator $a + b$ and denominator $c + d$.

Roots and Radicals

The square root is created with `\sqrt{expression}`. For example, `\sqrt{x^2 + y^2}` renders the square root of the sum of squares. To specify other roots such as cube roots, the syntax is `\sqrt[n]{expression}`, where n is the degree of the root.

Exponents and Subscripts

Superscripts and subscripts are written using the caret `^` and underscore `_` symbols respectively. For multi-character exponents or subscripts, braces `{ }` are essential to group the content, e.g., `x^{n+1}` or `a_{ij}`.

Greek Letters and Symbols

Greek letters are pervasive in mathematical notation, representing variables, constants, and functions. LaTeX provides commands for both lowercase and uppercase Greek letters.

Lowercase Greek Letters

Common lowercase Greek letters include `\alpha`, `\beta`, `\gamma`, and `\delta`. These commands generate α , β , γ , and δ respectively. Most Greek letters have a direct command starting with a backslash.

Uppercase Greek Letters

Uppercase Greek letters are denoted with capitalized commands, such as `\Gamma`, `\Delta`, `\Theta`, and `\Pi`, which produce Γ , Δ , Θ , and Π respectively. These are often used to represent functions or special constants.

Additional Mathematical Symbols

LaTeX supports an extensive collection of symbols including infinity (`\infty`), partial derivative (`\partial`), and integrals (`\int`). These symbols are essential for representing advanced mathematical concepts.

Matrices and Arrays

Matrices and arrays are fundamental in linear algebra and other mathematical fields. LaTeX provides multiple environments to create matrices with different delimiters and alignments.

Matrix Environments

The `matrix` environment creates a matrix without brackets. To add parentheses, brackets, or braces, use `pmatrix`, `bmatrix`, or `Bmatrix` respectively. For example, the syntax:

```
\begin{pmatrix}
a & b \\
c & d
\end{pmatrix}
```

produces a matrix enclosed in parentheses.

Arrays

The `array` environment allows for more control over column alignment and formatting. It is similar to a tabular environment but for math mode. Column alignment can be specified using `l`, `c`, or `r` for left, center, or right alignment.

Common Matrix Commands

- `\begin{matrix} ... \end{matrix}` - matrix without delimiters
- `\begin{pmatrix} ... \end{pmatrix}` - matrix with parentheses
- `\begin{bmatrix} ... \end{bmatrix}` - matrix with square brackets

- `\begin{Bmatrix} ... \end{Bmatrix}` - matrix with curly braces
- `\begin{vmatrix} ... \end{vmatrix}` - matrix with single vertical bars
- `\begin{Vmatrix} ... \end{Vmatrix}` - matrix with double vertical bars

Equation Environments and Alignments

For complex documents, properly formatting equations and aligning multiple lines is crucial. LaTeX offers various environments to manage these requirements efficiently.

Equation Environment

The `equation` environment automatically numbers equations and centers them on the page. Usage is:

```
\begin{equation}
E = mc^2
\end{equation}
```

This produces a numbered equation for referencing.

Align Environment

The `align` environment, provided by the `amsmath` package, allows multiple equations to be aligned at specific points, typically at the equal sign or another operator. Each line is separated by `\\` and alignment points are marked with `&`. For example:

```
\begin{align}
a &= b + c \\
d &= e - f
\end{align}
```

This environment also numbers the equations by default.

Non-Numbered Equations

For unnumbered equations, the `equation*` or `align*` environments can be used. Alternatively, using `\[ ... \]` creates display math without numbering.

Operators and Relations

Mathematical operators and relational symbols form the core of mathematical expressions. LaTeX provides commands for a broad spectrum of these symbols to ensure clarity and precision.

Common Operators

Operators such as summation, product, limits, and integrals are generated with commands like `\sum`, `\prod`, `\lim`, and `\int`. These operators can have limits placed above and below by default in display mode or to the side in inline mode.

Relations and Inequalities

Relational operators include equality `=`, inequality `\neq`, less than or equal to `\leq`, greater than or equal to `\geq`, and subset relations `\subset`, `\subseteq`. These symbols are essential for expressing mathematical logic.

Logical Symbols

LaTeX also supports logical connectors such as `\land` (and), `\lor` (or), `\neg` (not), and quantifiers like `\forall` (for all) and `\exists` (there exists).

Special Mathematical Formatting

Advanced formatting features in LaTeX allow for improved readability and presentation of mathematical content, including accents, spacing, and text within math mode.

Accents and Modifiers

Commands like `\hat{x}`, `\bar{y}`, and `\vec{v}` place accents such as hats, bars, and arrows over variables to denote specific meanings in math contexts.

Spacing in Math Mode

Proper spacing can enhance the clarity of expressions. LaTeX provides commands like `\,` (thin space), `\;` (medium space), and `\quad` (large space) to manually adjust spacing within formulas.

Text in Math Mode

When including words or labels within mathematical expressions, use the `\text{...}` command from the `amsmath` package to ensure proper font and spacing. For example, `\text{if } x > 0` integrates text seamlessly in math mode.
