## Sample Math Olympiad Problems and Solutions

Examining sample problems provides valuable insight into the nature of math olympiad problems for middle school and illustrates practical application of concepts and strategies.

### Problem 1: Algebraic Reasoning

*If  $3x + 2 = 17$ , what is the value of  $5x - 4$ ?*

**Solution:** First, solve for  $x$ :

$$3x + 2 = 17$$

$$3x = 15$$

$$x = 5$$

Now, calculate  $5x - 4$ :

$$5(5) - 4 = 25 - 4 = 21$$

### Problem 2: Geometry Application

*A triangle has sides of lengths 5, 12, and 13. What is its area?*

**Solution:** Recognize that 5, 12, and 13 form a right triangle (since  $5^2 + 12^2 = 25 + 144 = 169 = 13^2$ ). The legs are 5 and 12.

$$\text{Area} = (1/2) \times \text{base} \times \text{height} = (1/2) \times 5 \times 12 = 30$$

### Problem 3: Number Theory

*Find the greatest common divisor (GCD) of 48 and 180.*

**Solution:** Prime factorization:

- $48 = 2^4 \times 3$
- $180 = 2^2 \times 3^2 \times 5$

GCD is the product of the lowest powers of common primes:  $2^2 \times 3 = 4 \times 3 = 12$

## **Problem 4: Combinatorics**

*How many different ways can 3 students be selected from a group of 7?*

**Solution:** Use combinations formula:

$$C(7,3) = 7! / (3! \times (7-3)!) = (7 \times 6 \times 5) / (3 \times 2 \times 1) = 35$$
