Common Exercises and Solutions in the Moles Gizmo

The Moles Gizmo features a variety of exercises designed to reinforce fundamental concepts related to moles and chemical quantities. The answer key contains solutions that guide users through these problems, often involving conversions between mass, moles, and number of particles. Below are typical exercises found in the Gizmo along with explanations of how the answer key addresses them.

Calculating Number of Moles from Mass

One common exercise requires students to calculate the number of moles given the mass of a substance. The answer key provides the formula and step-by-step method:

1. Identify the substance and its molar mass (g/mol).
2. Use the formula: $\text{moles} = \text{mass} / \text{molar mass}$.
3. Calculate the answer and verify the units.

The answer key also includes explanations of molar mass determination and examples with different substances.

Converting Moles to Number of Particles

Another typical problem involves converting moles to particles using Avogadro's number (6.022×10^{23} particles/mol). The answer key guides users through:

- Understanding that one mole contains exactly 6.022×10^{23} particles.
- Using the formula: $\text{number of particles} = \text{moles} \times \text{Avogadro's number}$.
- Applying the calculation to atoms, molecules, or ions depending on the substance.

Determining Mass from Number of Moles

Exercises also require calculating mass when given moles. The answer key clarifies this by showing:

- Identification of the substance's molar mass.
- Use of the formula: $\text{mass} = \text{moles} \times \text{molar mass}$.
- Examples illustrating the conversion in practical scenarios.
