The Pega Certified System Architect (CSA) exam is designed to validate the skills and knowledge of individuals working with the Pega platform. It assesses the candidate's proficiency in building and configuring Pega applications, understanding core concepts, and following best practices in system architecture. The exam typically consists of multiple-choice questions that require a solid grasp of Pega's rules, design principles, and development methodologies. Passing this certification is often a prerequisite for advanced Pega certifications and is highly regarded by employers seeking skilled Pega developers and architects.

Exam Format and Duration

The CSA exam generally includes around 60 multiple-choice questions, to be completed within a 90-minute time frame. Questions are designed to evaluate both theoretical knowledge and practical application skills. The exam is conducted online through authorized testing platforms, ensuring accessibility for candidates worldwide. Each question may have one or more correct answers,

emphasizing the need for thorough understanding rather than guesswork.

Eligibility and Prerequisites

While there are no strict prerequisites for taking the Pega CSA exam, it is recommended that candidates have hands-on experience with Pega Platform and complete relevant training courses. Familiarity with Pega 7 or later versions, process modeling, case management, and user interface design significantly enhances readiness for exam questions. Organizations often encourage their technical staff to obtain this certification to standardize skill levels and improve project outcomes.

Types of Pega Certified System Architect Exam Questions

Pega certified system architect exam questions vary in format and complexity, encompassing different aspects of Pega system design and development. The primary question types include multiple-choice single answer, multiple-choice multiple answers, scenario-based questions, and drag-and-drop or matching questions in some versions of the test platform.

Multiple-Choice Single Answer

These questions require selecting the one correct answer from several options. They test foundational knowledge and are often straightforward but may include trickier questions that assess nuanced understanding.

Multiple-Choice Multiple Answers

Questions in this format require selecting all correct answers from a list. They evaluate comprehensive knowledge and attention to detail, ensuring candidates can distinguish between partially correct and fully correct solutions.

Scenario-Based Questions

Scenario-based questions present real-world business cases or technical challenges. Candidates must apply their theoretical knowledge to propose the best solutions, considering Pega's capabilities and constraints. These questions often assess decision-making, problem-solving, and architectural design skills.

Drag-and-Drop or Matching Questions

Although less common, some exam platforms include interactive question types such as matching terms to definitions or dragging steps into the correct order. These test the candidate's understanding of processes, terminology,

and workflow sequences.
