## Understanding Moon Phases

The moon goes through several phases in its 29.5-day lunar cycle, reflecting how much of its surface is illuminated by the sun as viewed from Earth. These phases are essential for various reasons, including navigation, agriculture, and cultural significance.

## The Eight Phases of the Moon

1. New Moon: The moon is positioned between the Earth and the sun, making it invisible from our perspective.
2. Waxing Crescent: A sliver of the moon becomes visible as it begins to move away from the new moon phase.
3. First Quarter: Half of the moon is illuminated, and it appears as a semi-circle.
4. Waxing Gibbous: More than half of the moon is illuminated as it approaches the full moon phase.
5. Full Moon: The entire face of the moon is illuminated and appears as a complete circle.
6. Waning Gibbous: The illumination begins to decrease after the full moon.
7. Last Quarter: Similar to the first quarter, half of the moon is illuminated, but the opposite side is lit.
8. Waning Crescent: Only a small sliver remains visible as the moon approaches the new moon phase again.
