Basic Data Science Workflow

To effectively apply Python for data science, you need to follow a structured workflow. Here is a basic outline of the typical data science process:

1. **Problem Definition:** Clearly articulate the problem you are trying to solve.
2. **Data Collection:** Gather data from various sources, such as databases, APIs, or web scraping.
3. **Data Cleaning:** Clean and preprocess the data to handle missing values and eliminate inconsistencies.
4. **Exploratory Data Analysis (EDA):** Use visualization and statistics to explore the data and find patterns or insights.
5. **Model Building:** Choose the appropriate machine learning model and train it using the cleaned data.
6. **Model Evaluation:** Assess the model's performance using metrics like accuracy, precision, recall, and F1 score.
7. **Deployment:** Deploy the model for real-world use, which may involve integrating it into an application or creating a web service.
