Overview of RelyX Unicem 2

Product Description

RelyX Unicem 2 is a dual-cure, self-adhesive resin cement designed for permanent cementation of indirect restorations. It features a simplified application process by eliminating the need for separate etching and bonding steps. The cement offers strong adhesion to a variety of dental substrates, including enamel, dentin, metal, and ceramic materials. Its formulation provides excellent mechanical properties, resistance to moisture, and low solubility, making it suitable for long-term clinical success.

Indications for Use

This cement is indicated for luting metal, ceramic, composite, and resin

inlays, onlays, crowns, bridges, and posts. It is particularly advantageous in situations requiring a streamlined workflow without compromising bond strength. RelyX Unicem 2 is compatible with light-curing, self-curing, or dual-curing techniques, providing versatility in different clinical scenarios.

Preparation and Handling

Surface Preparation

Proper preparation of the tooth surface and restoration is vital to ensure optimal bonding with RelyX Unicem 2. The tooth surface should be clean, free of saliva, blood, and debris. No additional etching or bonding agents are necessary; however, if contamination occurs, the surface must be thoroughly rinsed and dried. For ceramic restorations, sandblasting or etching with hydrofluoric acid (where appropriate) can enhance mechanical retention.

Mixing and Dispensing

RelyX Unicem 2 is available in a capsule delivery system for automatic mixing. The capsules should be mixed in an amalgamator for 10 seconds to achieve a homogeneous consistency. After mixing, the capsule tip is removed, and the mixed cement is dispensed directly onto the restoration or into the tooth preparation. The working time after mixing is approximately 2 minutes, so timely application is essential to prevent premature setting.

Clinical Tips

- Ensure the capsule is stored at room temperature before mixing to facilitate proper consistency.
- Use a gentle application technique to avoid air bubbles in the cement layer.
- Keep the working area dry but avoid desiccation of the dentin to maintain adhesion quality.

Cementation Procedure

Application Steps

The cementation process with RelyX Unicem 2 follows a straightforward protocol designed to minimize technique sensitivity. After preparing the tooth and restoration, dispense the mixed cement onto the internal surface of the restoration or directly into the cavity. Seat the restoration promptly with firm pressure to ensure complete seating and adaptation.

Excess Cement Removal

Initial removal of excess cement should be performed immediately after seating using a suitable instrument or brush. Because the cement begins to set quickly, early cleanup reduces the risk of hardened residues that are difficult to remove and can affect the margin integrity. Final polishing is recommended after complete curing to achieve smooth restoration margins.

Working and Setting Times

The working time of RelyX Unicem 2 is approximately 2 minutes from the start of mixing, with an initial set occurring within 3 to 4 minutes in self-cure mode. Light-curing can accelerate the setting process, with full cure achieved in seconds under adequate light intensity. Clinicians should coordinate seating and cleanup steps within these time frames to optimize results.

Curing and Finishing

Curing Methods

RelyX Unicem 2 can be cured chemically (self-cure), by light activation, or through a dual-cure approach. Light curing is recommended to ensure rapid polymerization, especially in thin restorations where light transmission is sufficient. For thicker or opaque restorations, self-curing guarantees complete setting in areas inaccessible to light. Proper curing enhances the mechanical properties and reduces the risk of postoperative sensitivity.

Finishing and Polishing

After curing, residual cement should be carefully removed, and margins polished using appropriate rotary instruments or polishing discs. This step is crucial to prevent plaque accumulation and ensure gingival health. Polishing also improves the esthetic integration of the restoration by creating a smooth surface finish.

Storage and Safety Guidelines

Storage Conditions

To maintain the efficacy of RelyX Unicem 2, capsules should be stored in a cool, dry place away from direct sunlight. Avoid exposure to temperatures above 77°F (25°C) or below 41°F (5°C) as extreme temperatures can affect the material's properties and working time. Check expiration dates regularly and discard expired capsules to prevent compromised bonding performance.

Safety Precautions

As with all dental materials, appropriate personal protective equipment such as gloves and eye protection should be used when handling RelyX Unicem 2. Avoid contact with skin and eyes; in case of accidental exposure, rinse thoroughly with water. Dispose of unused cement according to local regulations. Proper ventilation in the operatory is recommended to minimize inhalation of any material vapors during mixing and curing.

Frequently Asked Questions

What are the basic steps for using RelyX Unicem 2 self-adhesive resin cement?
